Common Liquid Fertilisers

Liquid Tomato Food
Does what it says on the bottle, can also be used for courgettes, marrows, pumpkins, etc with good results.

Maxicrop
Not a fertiliser as such, more of a growth promoter. Particularly helps newly established plants to root well.

Comfrey
The leaves steeped in water are a traditional liquid fertiliser. Leaves can be harvested several times a year and the fertiliser is made by soaking them in water for around 3 weeks before applying as a feed.

Comfrey is identified by its drooping purple/violet flowers and should always be bought as seed, or as root cuttings from reputable commercial suppliers, to avoid the risk of introducing the lookalike weed alkanet.

Liquid Manure
Horse manure steeped in water is also a traditional (if smelly) traditional liquid feed, held to be especially good for pumpkins and marrows.
Any container horse manure is being steeped in must be covered for hygiene reasons and should not be left to soak for more than two weeks at a time. Hand washing after use is (needless to say) a must.
